Create a Folded Paper Star Decoration

A five-point star folded from one original measured template

These are original printable digital plans for adult paper crafts. Dimensions are calculated; every finished size is nominal. Paper thickness, printer scaling, adhesive, cutting accuracy and folding technique can change the fit. There has been no physical printing, cutting, folding, gluing, fit test or durability test. Work at a clear table, keep sharp edges and wet adhesive away from children, and use only materials and adhesives that are suitable for the intended craft according to their labels. Keep food, flame, heat and electrical loads away from these objects.

What you will make

A flat five-point silhouette becomes a gently raised decorative paper star by creasing alternating lines from its centre. The same design can also be left flat as a greeting-card accent. The downloadable full-size outline has five long points and five indented valleys; it is a single piece, not five joined strips. A reader can practice the difference between a mountain crease and a valley crease while keeping the points in order.

The original drawing uses a mathematical outer radius of 65 mm and an inner radius of 29 mm, measured from the common centre to its alternating tips and notches. There are ten vertices in all. The radii specify the digital pattern; they are not measured finished dimensions after folding. No glue is required for the basic relief. The exercise is meant for a dry table display or a flat decoration attached to a disposable craft sheet, not a load-bearing hanging star, outdoor ornament or fire-resistant object.

Look first at the difference between a cut edge and a crease line. The solid ten-sided perimeter is cut; the five lines from the centre to an outer point are marked M for mountain on the visible face; the five lines to the inward notches are V for valley. Neither type of radial line should be cut. If the sheet cannot be folded without cracking, use it as a flat cut-out rather than forcing the relief.

Choose paper, prepare a workspace and print

Begin with a clean sheet of lightweight folding card, approximately 120-180 g/m2, or a sturdy craft paper that takes a neat crease. Those numbers are suggestions for a paper experiment and not a verified compatibility rating. A very rigid board may resist the small central folds. Work on a clear, dry surface with millimetre ruler, pencil, ordinary scissors, blunt scoring tool and a piece of scrap paper. Use labelled craft supplies according to the manufacturer. No knife, heated tool, machine, soldering, wire frame or powered equipment is necessary.

Choose the matching A4 or US Letter printable page. In the printer dialog use Actual Size or 100%, not Fit or Shrink. Locate the 50 mm reference bar near the bottom of each pattern sheet and check it with your own ruler. Adobe explains that Actual Size prints without scaling but can crop content beyond the printer area; that is why you must also check the entire star outline is present. If the bar is not 50 mm or a tip has been clipped, do not use that sheet as a full-size pattern.

One sheet contains one star; for practice, first make a trial on ordinary paper that you have no need to preserve. A front side may carry a pale colour or a simple repeating drawn motif. Keep the centre dot and all fold guides visible

until the creases are learned. A design printed on the reverse can show through thin stock; avoid decorating over the centre before you make the creases.

Understand the star geometry

The star is centred on the circular reference point labelled C. Its five outer tips are spaced at 72-degree intervals, because a full turn is 360 degrees and 360 divided by five is 72. An inner notch sits halfway between each pair of outer tips, 36 degrees from either neighbour. Alternating radii create a pointed silhouette without attaching separate components. A radius is a centre-to-vertex distance, not the width of the whole motif. The maximum diameter of the outer reference circle is 130 mm, but the actual horizontal width of the star is smaller because no two opposite outer tips must align on a single diameter.

The green dashed V lines run from C toward the five inward notches. Blue dotted M lines run from C toward the five long outer tips. The five shorter V guide lengths are 29 mm; the five longer M guide lengths are 65 mm. Pattern coordinates are computed from these distances and the 72-degree rotation; do not guess their position by measuring only a printed screenshot. The designed shape is symmetric when measured in the digital file. Real cutting and fold thickness will change the visible shape.

Use the printed legend to orient the intended front of the star toward you. A mountain fold makes a raised ridge on that front; a valley fold makes a groove on the front. Because the guide lines all meet at C, the centre needs gentler handling than a long, straight paper edge. It may be helpful to rehearse a single mountain and valley on a separate strip of scrap before you touch the ten-rayed figure.

Make the folds, one step at a time

1. Print the pattern at Actual Size and measure its 50 mm bar. Confirm all five pointed tips and five inward notches appear on the page; a missing corner is not a decorative alternative.
2. Identify the five M radial marks running from C to each long point and the five V radial marks running from C to each inner notch. Count five of each before cutting.
3. Choose which surface will be the front. Pencil a small removable dot at C on the reverse if you want to follow the centre once the printed face is turned over.
4. Work on scrap first: lift a paper strip into a mountain ridge and press it into a valley trough, noting the difference. Do not use a cutting blade to make the score.
5. With the star blank still part of its larger sheet, very lightly score each of the five M lines against the ruler, stopping exactly at the centre and the outer point. These are crease guides, not incisions.
6. Lightly score the five V lines from C to their inner notches. Avoid repeated pressing at C; each approach should end before the material is torn or punctured.
7. Cut around the solid perimeter with ordinary scissors. Follow each straight segment from long point to adjacent notch, turning the entire sheet for easier control at sharp angles.

8. Inspect the ten resulting vertices. Do not make a second interior cut at the valley notches; they are already shaped by the outside edge. Save an uncreased scrap star if you want to compare results.

9. Fold the first M line so it forms a ridge toward the designated front. Open gently. Repeat at the remaining four outer-point lines without pulling any one tip sharply.

10. Form the first V line as a trough toward the front. Open gently and repeat at the other four inner-notch lines. Work around the centre rather than jumping across it with a hard pinch.

11. Rest the star lightly on a flat surface and ease the alternating folds toward a shallow relief. Lift the centre only as far as the material permits. Do not force the vertices into a rigid three-dimensional star if the paper buckles.

12. If a neat raised star is not possible, flatten the creases and retain a flat cut-out; that is a legitimate completed craft result. Never punch through the centre simply to make the piece stand.

13. Keep the star flat or lightly supported in a dry, stable place. If attaching it to a disposable paper card, follow the label of a suitable paper adhesive and keep it away from valued original artwork.

14. Record the paper, actual calibration-bar measurement, fold direction, any torn point, and whether the star is displayed flat or shallowly raised on the two-page printable record.

Check the result, and avoid false promises

If a crease runs toward the wrong point, open the shape and check whether that line led to an outer tip (M) or an inward notch (V). Reverse only the incorrect crease gently; repeated reversals can weaken the centre. If the piece curls, check that all five mountain folds and all five valley folds are present and that no section was pulled further than the others. A star that never becomes raised may still be accurate as a flat template; folding behaviour is a property of the real paper.

If a notch tears, avoid disguising a damaged structural point with a sharp staple or wire. Trim a new copy rather than creating an unsafe repair. If colour cracks along a crease, a printed coating or thick board may not be suitable for this paper exercise. A smaller tool pressure may help on the next attempt, but that is advice for reader experimentation, not a manufacturing guarantee.

Never describe the decoration as heatproof, flameproof, weatherproof, child-safe or able to hold a hanging weight. Keep it away from candles and other ignition sources, water, food, pets and small children. The digital proportions are calculated and independently checked as vector dimensions, but the publishing team has not physically printed, cut, folded or strength-tested a paper prototype.

Ideas for personalising your decoration

Draw one different dot or line motif on each long tip while keeping the central junction clear. Alternating two ink colours can make the fivefold symmetry easier to see when the relief is turned in the light. If using a preprinted paper, put broad decoration away from the radial crease lines to reduce unwanted visual clutter. A shallow star can sit on a removable, separate card backing rather than being glued to an heirloom.

To enlarge or reduce the template deliberately, you must scale the outer radius, inner radius and all crease coordinates by the same factor. A 90% print of this specific design would change the nominal outer radius from 65 mm to 58.5 mm and the inner radius from 29 mm to 26.1 mm; those are calculated examples, not the validated full-size reference. Label any scaled variation with its new dimensions. If it no longer fits on the intended printer, select a suitable sheet or draw it from the revised measurements rather than allowing automatic fitting.

Sources, original rights and limitations

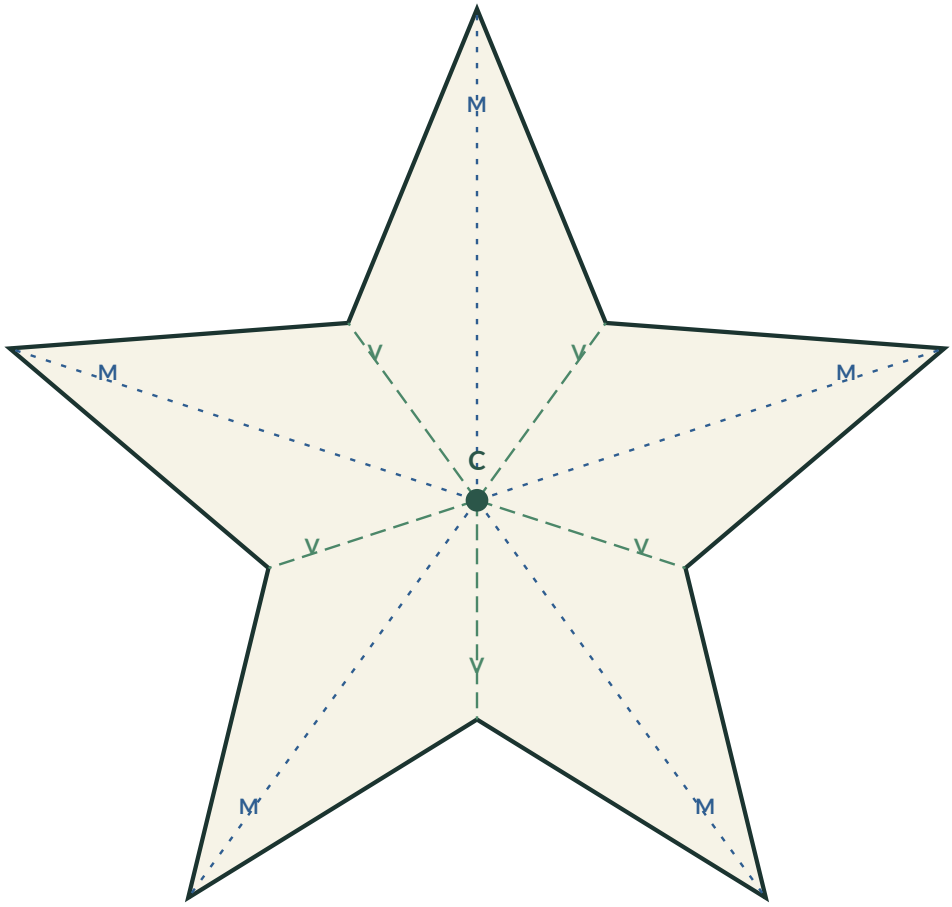
STP-MAKE-F030 / FULL-SIZE FIVE-POINT STAR

Cut solid perimeter. Blue dotted = M mountain, green dashed = V valley. All from centre C.



Exact original radii: outer 65 mm to each of five tips; inner 29 mm to each of five notches. Five M and five V radial guides; do not cut guides.

50 mm SCALE CHECK - measure with a ruler; must equal 50 mm

STP-MAKE-F030 / MAKER RECORD / PAGE 1

Write your own readings and decisions; no physical trial was performed by Steadleaf Press.

Paper type and approximate weight

Page format and Actual Size print setting

50 mm scale bar measured by reader

Count of M creases / V creases

Centre condition after folding

Chosen final display: flat / shallow relief

Any tip tear or change proposed

Record an actual observation only if you perform it yourself.

50 mm SCALE CHECK - measure with a ruler; must equal 50 mm

STP-MAKE-F030 / MAKER RECORD / PAGE 2

Write your own readings and decisions; no physical trial was performed by Steadleaf Press.
